

Novel quinoline-carboxamides as JAK3 kinase modulators

The present invention relates to novel compounds which are JAK3 Kinase inhibitors,
5 processes for their preparation, pharmaceutical compositions containing them and their use
in therapy.

Janus Kinase 3 (JAK3) is a member of the Janus family of protein kinases. Although the
other members of this family are expressed by essentially all tissues, JAK3 expression is
10 limited to hematopoietic cells. This is consistent with its essential role in signaling through
the receptors for IL-2, IL-4, IL-7, IL-9, IL-13 and IL-15 by non-covalent association of
JAK3 with the gamma chain common to these multichain receptors. These cytokines all
have a shared function in that they are involved in lymphocyte differentiation and
proliferation. XSCID patient populations have been identified with severely reduced levels
15 of JAK3 protein or with genetic defects to the common gamma chain, suggesting that
immunosuppression should result from blocking signaling through the JAK3 pathway.
Animal studies have suggested that JAK3 not only play a critical role in B- and T-
lymphocyte maturation, but that JAK3 is constitutively required to maintain T-cell function.
Modulation of immune activity through this novel mechanism can prove useful in the
20 treatment of T-cell proliferative disorders such as transplant rejection and autoimmune
diseases.

The role of JAK3 in mast cells has been described in knockout mice. Thus, IgE/antigen
induced degranulation and mediator release were substantially reduced in mast cells
25 generated from JAK3 deficient mice. JAK3 deficiency does not affect mast cell
proliferation in vitro, it has also been shown that IgE receptor levels and mediator contents
are identical in JAK3^{-/-} and JAK3^{+/+} mast cells. Therefore, JAK3 appears essential for the
complete response of IgE challenged mast cells. The role of JAK3 in mast cell activation
has been well established in murine system, however, there is no published data on mast cell

function in the AR-SCID patients. Targeting JAK3 provides the basis for new and effective treatment of mast cell mediated allergic reactions.

JAK3 inhibitors which have been disclosed to date include quinazolines (Sudbeck, E. A. et al. Clinical Cancer Res. 5(1999)1569-82, WO 00/0202) and pyrrolo[2,3-d]pyrimidines (Blumenkopf, T. A. et al. WO 99/65909). 4-anilinoquinoline-3-carboxamides having JAK3 inhibitory activity are described in WO 02/092571. In WO 00/18761 and WO 98/43960 there are disclosed substituted quinoline-3-carbonitrile derivatives which are stated to have kinase inhibitory activity.

Quinoline derivatives having other pharmaceutical uses, for example as antiulcer agents, phosphodiesterase inhibitors or gastric acid secretion inhibitors are described in EP 0 259 174, EP 0 346 208, EP 0 480 052 and WO 2004/103998.

Unless otherwise indicated, the term 'alkyl' when used alone or in combination, refers to a straight chain or branched chain alkyl moiety. A C₁-C₈ alkyl group has from one to eight carbon atoms including methyl, ethyl, n-propyl, isopropyl, tert-butyl, n-pentyl, n-hexyl and the like. References to individual alkyl groups such as "propyl" are specific for the
 25 straight-chain version only, references to individual branched-chain alkyl groups such as "isopropyl" are specific for the branched-chain version only.

Analogously, the term 'C₁-C₈ alkoxy', when used alone or in combination, will be understood to refer to straight or branched chain groups having from one to eight or from

one to four carbon atoms respectively and includes such groups as methoxy, ethoxy, propoxy, isopropoxy and butoxy.

5 The term 'cycloalkyl', when used alone or in combination, refers to a saturated alicyclic moiety having from three to eight carbon atoms and includes, for example, cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl and cycloheptyl.

The term aryl includes phenyl and naphthyl groups.

10 A C₂-C₄ alkenyl group is for example vinyl or allyl. A C₂-C₄ alkynyl group is for example ethynyl or propyn-2-yl.

'Optionally substituted' is used herein to indicate optional substitution by the group or groups specified at any suitable available position.

A 'heteroatom' is a nitrogen, sulphur or oxygen atom. Where rings include nitrogen atoms, these may be substituted as necessary to fulfil the bonding requirements of nitrogen or they may be linked to the rest of the structure by way of the nitrogen atom. Nitrogen atoms may also be in the form of N-oxides. Sulphur atoms may be in the form of S, S(O) or SO₂. In a
20 heterocyclic ring, a -CH₂- group can optionally be replaced by a -C(O).

As used herein, the term 'halogen' includes fluorine, chlorine, bromine and iodine.

25 A 'saturated or unsaturated 4- to 10-membered ring, which ring may optionally comprise one or more heteroatoms selected from nitrogen, oxygen and sulphur' may be a saturated, partially saturated or unsaturated monocyclic or bicyclic ring. The ring may be a carbocyclic (that is an alicyclic ring having ring carbon atoms only) or is a heterocyclic ring containing four to ten atoms of which at least one is a heteroatom selected from nitrogen, oxygen and sulphur and which ring may, unless otherwise specified, be carbon or nitrogen linked.
30 Examples of suitable carbocyclic rings include cyclobutyl, cyclopentyl, cyclohexyl and

cycloheptyl. Suitably a 4- to 10-membered heterocyclic ring may be pyridyl, imidazolyl, isoxazolyl, pyrazolyl, furyl, pyrazinyl, pyridazinyl, pyrimidinyl, pyrrolyl, thiazolyl, oxazolyl, isothiazolyl,, triazolyl, tetrazolyl, thienyl, pyrrolidinyl, piperidinyl, thiomorpholinyl, morpholinyl, tetrahydrofuranyl, piperazinyl, imidazopyrrole, indole, isoindole, indoline, isoindazole, benzimidazole, purine, quinolyl (for example, 1,2-dihydroquinolyl or 1,2,3,4-tetrahydroquinolyl), isoquinolyl, cinnolyl, quinazolyl, quinoxalyl, benzoxazole, benzothiazole, imidazopyridinyl, imidazopyrimidinyl, imidazopyrazinyl. A saturated monocyclic 4- to 7- membered ring comprising one or more heteroatoms selected from nitrogen, oxygen and sulphur will accordingly be understood to mean a heterocyclic ring containing four to seven atoms and which may, unless otherwise specified, be carbon or nitrogen linked. Particular examples of such ring systems include pyrrolidinyl and piperidinyl as included in the above list.

A '4-to 7-membered heteroaromatic ring comprising at least one ring heteroatom selected from nitrogen, oxygen and sulphur' is a fully unsaturated, aromatic monocyclic ring containing from four to seven atoms of which at least one is a heteroatom selected from nitrogen, oxygen and sulphur, which ring may, unless otherwise specified, be carbon or nitrogen linked. Particular examples of such ring systems include pyridyl, imidazolyl, isoxazolyl, pyrazolyl, furyl, pyrazinyl, pyridazinyl, pyrimidinyl, pyrrolyl, thiazolyl, oxazolyl, isothiazolyl,, triazolyl, tetrazolyl or thienyl as given above.

It will be appreciated that the number and nature of substituents on rings in the compounds of the invention will be selected so as to avoid sterically undesirable combinations.

and pharmaceutically acceptable salts and solvates of any one thereof.

Where the compounds according to the invention contain one or more asymmetrically substituted carbon atoms, the invention includes all stereoisomers, including enantiomers
15 and diastereomers, and mixtures including racemic mixtures thereof. Tautomers and mixtures thereof are also included.

Racemates may be separated into individual enantiomers using known procedures (cf. Advanced Organic Chemistry: 3rd Edition: author J March, p104-107). A suitable
20 procedure involves formation of diastereomeric derivatives by reaction of the racemic material with a chiral auxiliary, followed by separation, for example by chromatography, of the diastereomers and then cleavage of the auxiliary species.

The compounds according to the invention may be provided as pharmaceutically acceptable
25 salts. Suitable pharmaceutically acceptable salts include base salts such as an alkali metal salt for example sodium, an alkaline earth metal salt for example calcium or magnesium, an organic amine salt for example triethylamine, morpholine, N-methylpiperidine, N-ethylpiperidine, procaine, dibenzylamine, N,N-dibenzylethylamine or amino acids for example lysine. In another aspect, where the compound is sufficiently basic, suitable salts

include acid addition salts such as methanesulphonate, fumarate, hydrochloride, hydrobromide, citrate, maleate and salts formed with phosphoric and sulphuric acid.

The present invention further provides a process for the preparation of a compound of formula (I) as defined above, or a pharmaceutically acceptable salt thereof, which comprises:

(a) reaction of a compound of formula (II):

in which R^1 and R^2 are as defined in formula (I) or are protected derivatives thereof and R^{20} is a leaving group, with a compound of formula (III):

in which R^x and R^a are as defined in formula (I) or a protected derivative thereof, or

(b) for compounds of formula (I) where R^1 and/or R^2 are groups $Y(CR^3_2)_pNR^4R^5$, $Y(CR^3_2)_pCONR^4R^5$, $Y(CR^3_2)_pCO_2R^6$, $Y(CR^3_2)_pOR^6$ or $Y(CR^3_2)_pR^6$ where Y is oxygen, reaction of a compound of formula (IV):

where the $R^{1'}$ or $R^{2'}$ to be converted into a group $Y(CR^3_2)_pNR^4R^5$, $Y(CR^3_2)_pCONR^4R^5$, $Y(CR^3_2)_pCO_2R^6$, $Y(CR^3_2)_pOR^6$ or $Y(CR^3_2)_pR^6$ is hydroxy and the other $R^{1'}$ or $R^{2'}$ together with R^x are as defined above for process (a) with a compound of formula (V):

5

where R^{21} is NR^4R^5 , $CONR^4R^5$, CO_2R^6 , OR^6 or R^6 and R^4 , R^5 and R^6 are as defined in formula (I) or are protected derivatives thereof,

10

and optionally thereafter process (a) or (b)

- removing any protecting groups
- converting a compound of formula (I) into a further compound of formula (I)
- forming a pharmaceutically acceptable salt or solvate.

15

In process (a) the group R^{20} is a leaving group such as halogen, in particular chloro. The reaction can be carried out in an inert solvent such as DMF at elevated temperature, for example at about 100°C.

- 20 In process (b) the leaving group L is preferably halogen, in particular chloro. The reaction can be carried out in the presence of a base such as cesium carbonate in an inert solvent such as DMF or ethanol.

Compounds of formula (II) can be prepared by reacting compounds of formula (VI):

25

(VI)

in which R^1 , R^2 and R^{20} are as defined in formula (II) with a chlorinating agent such as thionyl chloride, and reaction of the corresponding acid chloride with ammonia.

5

Compounds of formula (VI) can be prepared using methods conventional in the art.

Compounds of formula (I) can be converted into further compounds of formula(I) using standard procedures conventional in the art.

10

Examples of the types of conversion reactions that may be used include introduction of a substituent by means of an aromatic substitution reaction, reduction of substituents, alkylation of substituents and oxidation of substituents. The reagents and reaction conditions for such procedures are well known in the chemical art and are illustrated in the Examples below. By way of example, a hydroxy group may be replaced with a chloro group by reaction with a chlorinating agent such as thionyl chloride and the chloro group may itself undergo nucleophilic substitution. Alternatively a chloro substituent may be treated with sodium azide to replace the chloro group with an azido group which in turn may be reduced to an amine group. Amine groups may conveniently be acylated with acid chlorides or isocyanates and converted into amides by treatment with appropriate acids.

20

It will be appreciated that certain functional groups may need to be protected using standard protecting groups. The protection and deprotection of functional groups is for example, described in 'Protective Groups in Organic Chemistry', edited by J. W. F. McOmie, Plenum Press (1973), and 'Protective Groups in Organic Synthesis', 3rd edition, T. W. Greene & P. G. M. Wuts, Wiley-Interscience (1999).

25

Diseases mediated by JAK3 include inflammatory, immunological, and bronchopulmonary disorders.

30

The present invention also relates to a pharmaceutical composition for (a) treating or preventing a disorder or condition selected from organ transplant rejection, lupus, multiple sclerosis, rheumatoid arthritis, psoriasis, Type I diabetes and complications from diabetes, cancer, asthma, rhinitis, atopic dermatitis, autoimmune thyroid disorders, ulcerative colitis, Crohn's disease, Alzheimer's disease, leukemia, and other autoimmune diseases or (b) the inhibition of protein tyrosine kinases or Janus kinase 3 (JAK3) in a mammal, including a human, comprising an amount of a compound of formula I or a pharmaceutically acceptable salt thereof, effective in such disorders or conditions and a pharmaceutically acceptable carrier.

10

Preferably the compounds of the invention are used for the treatment of asthma, rheumatoid arthritis, and host versus graft rejection/transplantation.

The present invention also relates to a pharmaceutical composition for (a) treating or preventing a disorder or condition selected from organ transplant rejection, lupus, multiple sclerosis, rheumatoid arthritis, psoriasis, Type I diabetes and complications from diabetes, cane, asthma, rhinitis, atopic dermatitis, autoimmune thyroid disorders, ulcerative colitis, Crohn's disease, Alzheimer's disease, leukemia, and other autoimmune diseases or (b) the inhibition of protein tyrosine kinases or Janus kinase 3 (JAK3) in a mammal, including a human, comprising an amount of a compound of formula I or a pharmaceutically acceptable salt thereof, alone or in combination with a T-cell immunosuppresant or anti-inflammatory agents, effective in such disorders or conditions and a pharmaceutically acceptable carrier.

The present invention also relates to a method for the inhibition of protein tyrosine kinases or Janus Kinase 3 (JAK3) in a mammal, including human, comprising administering to said mammal an effective amount of a compound of formula I or a pharmaceutically acceptable salt thereof.

The dose of the compound to be administered will depend on the relevant indication, the age, weight and sex of the patient and may be determined by a physician. The dosage will preferably be in the range of from 0.1 mg/kg to 100 mg/kg.

- 5 The compounds may be administered topically, e.g. to the lung and/or the airways, in the form of solutions, suspensions, HFA aerosols or dry powder formulations, e.g. formulations in the inhaler device known as the Turbuhaler®; or systemically, e.g. by oral administration in the form of tablets, pills, capsules, syrups, powders or granules, or by parenteral administration, e.g. in the form of sterile parenteral solutions or suspensions, or by rectal
10 administration, e.g. in the form of suppositories.

The compounds of the invention may be administered on their own or as a pharmaceutical composition comprising the compound of the invention in combination with a pharmaceutically acceptable diluent, adjuvant or carrier. Particularly preferred are
15 compositions not containing material capable of causing an adverse, e.g. an allergic, reaction.

Dry powder formulations and pressurized HFA aerosols of the compounds of the invention may be administered by oral or nasal inhalation. For inhalation the compound is desirably
20 finely divided. The finely divided compound preferably has a mass median diameter of less than 10 μm , and may be suspended in a propellant mixture with the assistance of a dispersant, such as a C₈-C₂₀ fatty acid or salt thereof, (e.g. oleic acid), a bile salt, a phospholipid, an alkyl saccharide, a perfluorinated or polyethoxylated surfactant, or other pharmaceutically acceptable dispersant.

25

The compounds of the invention may also be administered by means of a dry powder inhaler. The inhaler may be a single or a multi dose inhaler, and may be a breath actuated dry powder inhaler.

- 30 One possibility is to mix the finely divided compound with a carrier substance, e.g. a mono-

, di- or polysaccharide, a sugar alcohol, or an other polyol. Suitable carriers are sugars, e.g. lactose, glucose, raffinose, melezitose, lactitol, maltitol, trehalose, sucrose, mannitol; and starch. Alternatively the finely divided compound may be coated by another substance. The powder mixture may also be dispensed into hard gelatine capsules, each containing the
5 desired dose of the active compound.

Another possibility is to process the finely divided powder into spheres which break up during the inhalation procedure. This spheronized powder may be filled into the drug reservoir of a multidose inhaler, e.g. that known as the Turbuhaler® in which a dosing unit
10 meters the desired dose which is then inhaled by the patient. With this system the active compound, with or without a carrier substance, is delivered to the patient.

For oral administration the active compound may be admixed with an adjuvant or a carrier, e.g. lactose, saccharose, sorbitol, mannitol; a starch, e.g. potato starch, corn starch or
15 amylopectin; a cellulose derivative; a binder, e.g. gelatine or polyvinylpyrrolidone, and/or a lubricant, e.g. magnesium stearate, calcium stearate, polyethylene glycol, a wax, paraffin, and the like, and then compressed into tablets. If coated tablets are required, the cores, prepared as described above, may be coated with a concentrated sugar solution which may contain e.g. gum arabic, gelatine, talcum, titanium dioxide, and the like. Alternatively, the
20 tablet may be coated with a suitable polymer dissolved in a readily volatile organic solvent.

For the preparation of soft gelatine capsules, the compound may be admixed with e.g. a vegetable oil or polyethylene glycol. Hard gelatine capsules may contain granules of the compound using either the above mentioned excipients for tablets. Also liquid or semisolid
25 formulations of the drug may be filled into hard gelatine capsules.

Liquid preparations for oral application may be in the form of syrups or suspensions, for example solutions containing the compound, the balance being sugar and a mixture of ethanol, water, glycerol and propylene glycol. Optionally such liquid preparations may

contain colouring agents, flavouring agents, saccharine and/or carboxymethylcellulose as a thickening agent or other excipients known to those skilled in art.

The compounds of the invention may also be administered in conjunction with other
5 compounds used for the treatment of the above conditions.

The term 'medical therapy' as used herein is intended to include prophylactic, diagnostic and therapeutic regimens carried out in vivo or ex vivo on humans or other mammals. The terms "therapeutic" and "therapeutically" will be understood accordingly.

10 The following Examples illustrate the invention.

General methods

15 All reactions were performed in dried glassware in an argon atmosphere at room temperature, unless otherwise noted. All solvents and reagents and solvents were used as received. Merck Silica gel 60 (0.040-0.063 mm) was used for preparative silica gel chromatography. A Kromasil KR-100-5-C18 column (250 x 20 mm, Akzo Nobel) and mixtures of acetonitrile/water at a flow rate of 10 ml/min was used for preparative HPLC.
20 Reactions were monitored at 254 nm by analytical HPLC, using a Kromasil C-18 column (150 x 4.6 mm) and a gradient (containing 0.1% trifluoroacetic acid) of 5 to 100% of acetonitrile in water at a flow rate of 1 ml/min. Evaporations of solvents were performed under reduced pressure using a rotary evaporator at a maximum temperature of 40°C.

Products were dried under reduced pressure at 40 °C.
25 ¹H-NMR spectra were recorded on a Varian Inova-400 or Unity-500+ instrument. The central solvent peak of chloroform-d (δ_H 7.27 ppm), dimethylsulfoxide-d₆ (δ_H 2.50 ppm) or methanol-d₄ (δ_H 3.35 ppm) were used as internal references. Low resolution mass spectra obtained on a Hewlett Packard 1100 LC-MS system equipped with a APCI ionisation chamber.

A mixture of 4-chloro-6,7-diethoxyquinoline-3-carboxamide (96.5 mg, 0.33 mmole), *tert*-
butyl 3-amino-2-ethylbenzylcarbamate (prepared according to WO 02/092571) (119 mg,
0.476) in NMP (2 ml) was heated over night at 115 C. After cooling the solution was diluted
with water and basified with NaHCO₃. The compound was extracted from the aqueous
20 solution with ethylacetate (3x). The extracts were washed with water (2x), brine (2x), dried
(Na₂SO₄), and evaporated. The residue was purified by silica chromatography
(CH₂Cl₂/MeOH) to give 105 mg (62%) of the title compound as a white powder.

15 JAK3 HTRF assay

The JAK3 kinase assay utilizes a fusion protein (Jak3 kinase domain fused to Glutathione S-transferase, GST) coexpressed in E.Coli with GroEL/S, and purified by affinity chromatography on Glutathione Sepharose. The enzyme is diluted in 10 mM Tris-HCl, 150
20 mM NaCl, 5% mannitol, 2 mM 2-mercaptoethanol and 30% glycerol. The substrate in the kinase reaction is a biotinylated peptide of the autophosphorylation site of JAK3 (biotin-LPDKDYYVVREPG) used at 2 μ M. Assay conditions are as follows: JAK3, compound and substrate are incubated in 25 mM Trizma base, 5 mM MgCl₂, 5 mM MnCl₂, 0.05% TritonX-100 and 2 μ M ATP for 45 min at RT. Reaction volume is 20 μ M. Stopsolution is
25 added for a final concentration of 100 μ M EDTA. Finally 0.065 mg/ml PT66-K and 10.42 μ M SA-XL665 are added in 50 mM Hepes, 0.5 M KF and 0.1% BSA. The plate is read in a Discovery instrument after 60 min incubation.
